Overall Goal

3

The Silver Platter

Help the reviewer.

1. Follow the directions.

- Structure your proposal exactly as prescribed.
- Don't get creative!
- Don't skip any sections.
- Get in touch early with questions for the funder.

Help the reviewer.

2. Get out of the way of the information

- Drop the jargon.
- Be explicit, specific, and precise.
- Don't bury the lede.

Help the reviewer.

3. Export your thoughts.

- Get everything out of your head and in writing.
- Build your logframe from the start.
- Use visuals to show how you conceptualize the problem/solution.

Export your thoughts.

Get it out of your:

- Head
- Notes
- Emails
- Related proposals

And into one dedicated document.

Export your thoughts.

Build your logframe from Day One ...and keep it current!

- Serves as an outline
- Stress-tests your idea
- Quick reference
- Keeps the team on the same page

RI_Project Logframe_17APR17

PROJECT TITLE: 17_IV_094_Asia_M_Seagrass Ecosystems Logical framework – ver 2

Context: Seagrasses are neglected in decision making leading to alarming rates of loss.

Impact: Long term conservation of seagrass-dependent biodiversity and ecosystem services for vulnerable coastal communities.

Outcome/ Overarching Project Goal: Seagrass ecosystem services are integrated into decision-making and business models to secure the productivity, resilience, connectivity and sustainability of the key ecosystem services locally and globally.					
Work Package	Output (results)	Activity	Deliverable	Indicator	Verification
WP1. Assessment	1.1. Seagrass Ecosystem Services and biodiversity assessed in 5 pilot sites (one in each project country) in the Indo-Pacific region	1.1.1 Modify or develop new methodology and monitoring tools/protocols for SES and biodiversity designed for community participation	<ul style="list-style-type: none"> At least 3 community participatory tools/protocols adapted or developed 	<ul style="list-style-type: none"> Availability of a standardized methodology for participatory biodiversity and seagrass data collection and monitoring 	
	1.2 Capacity for SES and biodiversity monitoring and assessment built	1.1.1 Modify or develop new methodology and monitoring tools/protocols for SES and biodiversity designed for community participation 1.1.2 Collect data on seagrass status and threats, involving Protected Area managers and communities	<ul style="list-style-type: none"> At least 3 community participatory tools/protocols adapted or developed 5 trainings provided to parastatal communities and stakeholders on seagrass and dependent biodiversity data collection using tools and techniques such as Seagrass Watch, Seagrass Spotter, SES methods etc. Total of + 150 stakeholders trained, (e.g. 30 per country, 10 per Protected Area, admin, local communities and volunteers) 5 site specific reports on seagrass status and threats (that review any existing baseline/relevant information) Maps of seagrass distribution, abundance, health and threats at 5 sites Seagrass vulnerability assessment undertaken at each of the five sites Methodology and monitoring protocols 	<ul style="list-style-type: none"> Community participatory tools Revised/updated 500 ha of seagrass meadows studied and mapped at 5 pilot sites Number of people trained Availability of a standardized methodology for participatory biodiversity and seagrass data collection and monitoring Reports on key seagrass ecosystem services at 5 pilot sites 	<ul style="list-style-type: none"> All data collected input into RI website for sharing Reports to the donor (financial, progress, technical)
	1.1.2 Identify relevant sector/ policy needs for SES		<ul style="list-style-type: none"> 5 workshops to discuss sector/ policy needs and build capacity for ecosystem services Policy review report with which includes needs assessment for each site/country 5 workshops with relevant institutions (stakeholders) to present the results from the policy review and define policy questions for the purpose of the SES assessment Capacity building for ecosystem services of +150 stakeholders, incl. decision-makers, academia, NGO in 5 seagrass sites built 	<ul style="list-style-type: none"> 5 workshops to discuss sector/ policy needs Number of decision-makers in 5 countries/sites/countries whose capacity for ecosystem services was built Availability of a report on policy/ sector needs 	<ul style="list-style-type: none"> Progress reports Minister reports Training documentation Capacity building questionnaire surveys conducted before and after to assess the understanding of the need to value SES Policy Review Report
	1.1.3 Conduct biophysical and economic assessment of key SES		<ul style="list-style-type: none"> 5 country site specific reports on and maps of key SES (habitat loss, life cycle maintenance, food provisioning and cultural services) 	<ul style="list-style-type: none"> Euro values of at least 4 key SES Availability of a participatory methodology for SES assessment 	<ul style="list-style-type: none"> SES Reports SES Methods

Export your thoughts.

Use visuals to show:

- How **you** conceptualize the issue

Figure 1 – Environmental Governance Interventions

Correspondingly, the precision toxicology investigation (described in 2.2) progresses from uncertainty to greater certainty, identifying the health conditions and chemical mixtures prevalent in the community through stages of research that increasingly sharpen the association between pollution and the cause of harm to human health (Figure 2). These progressive stages of precision toxicology research begin with **informational** investigation, acting on community-identified priorities to produce data on the chemical and health conditions present; proceed to linkages **indicative** of causation, suggesting potential pathways of exposure to chemicals of high concentration with potential toxicological outcomes; demonstrate **relational** associations, qualitatively describing toxicity pathways by which specific mixtures of the identified chemicals induce adverse health outcomes; enable **probative** analysis, quantitatively determining how the community became exposed to the harmful chemicals and how these problems can be corrected; and generate **predictive** knowledge, prospectively indicating how such harms could be prevented in the future through processes such as containment or chemical re-engineering.

Risk

Risk ↓

High Risk, High Reward?

Risk ↓

Innovation
High Risk, High Reward

Risk

Key risk	Need to demonstrate	Example mitigation
YOU	Track record	Partnerships, Advisory Board
Stakeholders	Willingness Momentum Investment Agency	Piloting, letters of support/MOUs, bottom-up strategies, responsive/flexible approaches, participatory evaluation
Technical failure	Robust systems Safety Confidentiality Ease of use	Backups, trainings, security measures
Activity failure	Evidence of effectiveness	Resilient model (failure in one part does not cause the whole project to fail), ongoing monitoring & evaluation and adjustment
Sustainability	Self-sustaining mechanisms Sources of support	Leverage networks, ensure staff continuity, create transition plans

Risk

					Risk assessment				
Lp.	The main of risks	Owner of risk	Reason/cause	Effect	Probability	Impact	Level of risk	Risk response strategy	Cost of strate
Designing risk									
1	Lack of acceptance by Investor of design proposals	Investor	Delays in approval	Increase in costs due to the suspension of work of the design team	5-40%	50thous.-500thous	Low	Market observation, alternative designing solutions	0
2	Delays and difficulties in obtaining opinions and permits	Investor	Delay of designing work, unknown scope of design	Disturbed designing process	5-40%	500thous.-2millions	Medium	Earlier diagnosis of the situation in local authorities offices, organization of meetings preceding designing process	50thous.
3	Conflict among designing team members	Designer office	Insufficient flow of information among team members	Disturbed designing process	0-5%	50thous.-500thous	Low	Response of a team leader to all form of conflicts - mediation in a team	15thous.
4	Too optimistic assessment of employee workload	Designer office	Approval of unrealistic deadlines for individual work	Delay of designing work	5-40%	50thous.-500thous	Low	Proposing for employees to work overtime or ordering of part of work to another designing team	120thous.
5	Incorrect information from investor/lack of clear guidelines	Investor	Design may be issued with duplicate error or detected error can generate timing constraints	Verification of errors will increase costs and increase time due to the development of the next revision of design	40-70%	2-5 millions	High	Application to investor for extension of time to complete a design due to additional circumstances	20thous.
6	Staff do not have sufficient knowledge about the subject of design	Designer office	Errors in design	Verification of errors will increase time due to the repeated checks of designing work	5-40%	2-5 millions	Medium	Designing team leader strengthens control over work, providing for employees consultation with an expert	65thous.
Time risk									
7	Acceptance of unrealistic deadlines in contract	Designer office	Faulty contractual provisions	Deterioration of design quality of failure to meet the deadline	40-70%	2-5 millions	High	Employment of new employees or ordering part of work to another party during a contract	105thous.
Budget risk									
8	Underestimation of design budget	Investor	Budget may not be sufficient to carry out designing tasks	Deterioration of design quality	40-70%	2-5 millions	High	Limiting scope of design to necessary minimum	40thous.

Impact ↑

What could possibly get in the way of this project succeeding and what can I do to prevent that?

What might someone who doesn't know as much as I do perceive as a problem and how can I show that it's not?
